## Nurse's Corner

May is Melanoma/Skin Cancer Detection/Prevention Month. Skin cancer is the most common kind of cancer in the United States. There are 3 major types of skin cancer: basal cell carcinoma, squamous cell carcinoma, and melanoma (most dangerous). Ultraviolet (UV) radiation from the sun is the main cause of skin cancer. UV radiation can also come from tanning beds, tanning booths or sunlamps. Anyone can get skin cancer. Skin cancer can almost always be cured when found early and treated early. That is why it is a good idea to check your skin regularly for new growths (like moles or bumps) or changes in old growths. Tell your primary care provider right away. The best way to prevent skin cancer is to protect your skin from the sun and other sources of ultraviolet (UV) rays. Stay in the shade as much as possible between 10 am and 4 pm, use sunscreen with SPF 15 or higher and wear sunscreen even on cloudy days.
